

PATIENT LIST TYPES

- **Custom:** A custom list is defined by the user with a custom tab name. The user populates this list type with the patients they want to see.
- **Location:** Displays all patients associated with a particular location. Although the location may be chosen by the user, the list is not modifiable, and it is based on patient census.
- **Provider Group:** Displays the names of patients having a relationship with the user and/or other members of the user's provider group (such as a physician's practice members). This list is not modifiable from within PowerChart. A user must be a member of the Provider Group to view this list.
- **Visit Relationship:** Displays all the patients with whom a user has established the type of relationship chosen for the list.
